

My Journey From Learning Code to Solving Problems

Throughout my entire time coding I've ran into multiple problems but I was able to overcome them by asking for help from the people around me or by using AI.

The hardest part of learning to code was setting up the coding program. It was mainly difficult because I had to get help while working from home and I could not get help in person till we worked in office and even then it took two days to set it up because my chromebook needed to update, required more space, and the disk size of Linux was big enough but with help from my peers I was able to overcome the problems.

My first project that required coding was working on my personal portfolio. It wasn't a very complicated project. Most of the coding was already included because it was the first project we worked on in the summer job program. There were only minor issues when I was entering the code.

After finishing my portfolio webpage we were tasked to make a personal project. We had to find something we like then find an issue we could solve and use figma to help create the website. I chose to make a website to help people beat bosses. Figma made a website and diagram the only problem was that I didn't and still don't know how to pull the code from figma and put it on visual studio code. So I tried my best to put the the things onto visual studio code based off what I seen on the website in figma. I added in a searchbar I had to get the

code for it from chat gpt. Then I added the bosses information like it's name, strategy to beat them, their weaknesses, location and a youtube tutorial on how to beat them. I've only added one game and most of its bosses. Compared to the website Figma made it doesn't look very good but by itself... It still does not look very good the images I added sometimes work and other times do not. I had to change the colors so the words were more visible and for some reason my CSS doesn't work so I had to put the colors in the html file.

I'm currently working on a group project on trash recycling and compost. I did not really do that much coding. I mainly just pushed the README to github. For this project we used Figma. Except somehow they were able to get the code from Figma and with it and a couple of tweaks, Ke'shav was able to get the code working on Visual Studio and then we fact checked it worked on the about us page and we are now finished or almost finished with the project. We just have to work on presenting it.
